Portfolio at a glance

Six projects delivered across government, consultancy, banking, energy and healthcare between 2017 and today. Each case study below sets out the problem, my contribution, the result and the top skills the project demanded.

#	Organisation	Project	Period	Headline result
1	HMRC	GDPR data deletion and retention on enterprise data platforms	Jul 2022 – present	Compliant, fully auditable data-lifecycle rules for high-risk tax and income data
2	HMRC	DWIT: legacy data warehouse migration to cloud lakehouse and API transformation onto the Hybrid Integration Platform (HIP)	Jul 2022 – present	Governed, wave-based migration with traceable scope, mappings and reconciliation evidence
3	Accenture	Improving the DPS change-impacting process	Jan 2021 – Jul 2022	Impacting time cut from 50 to 27 days; 25% faster project delivery
4	Barclays	Automated credit-limit decision workflow	Aug 2019 – Dec 2020	Manual reviews down 40%; approvals cut from days to minutes
5	Octopus Energy	Smart meter installation journey redesign	Sep 2018 – Jul 2019	First-time installation success up 25% in six months
6	Black Country Healthcare NHS FT	Electronic Patient Record (EPR) requirements and procurement	Jun 2017 – Aug 2018	EPR procurement decision accelerated by 30%

1. HMRC — GDPR data deletion and retention

Role: Senior Business Analyst (contract) · **Period:** Jul 2022 – present · **Sector:** UK central government, SC cleared

Challenge. HMRC's enterprise data platforms hold high-risk tax and income datasets. They needed clear, enforceable rules for when personal data is deleted or retained, so the platforms meet GDPR obligations and stand up to audit.

What I did

- Led end-to-end requirements definition for the GDPR deletion and retention initiative.
- Mapped data flows across enterprise systems, producing as-is/to-be models, source-to-target mappings and transformation rules.
- Defined eligibility logic, automated deletion rules, retention timers, housekeeping jobs and handling of non-deletion reasons.
- Ran stakeholder interviews and workshops to align business, data, governance and security teams.
- Led solution validation through functional specification reviews and testing support, keeping traceability from need to delivered solution.

Result. A compliant, transparent and fully auditable data-lifecycle model for statutory data, with every rule traceable to a business and legal requirement.

Top skills required

Skill	How it was used
Requirements engineering and traceability	Turned statutory obligations into testable deletion and retention rules
Data flow and data mapping analysis	Source-to-target mappings and transformation rules across enterprise systems
Business rules definition	Eligibility logic, retention timers and non-deletion reason handling
Regulatory and data-governance knowledge	GDPR, retention policy and audit expectations
Stakeholder engagement and workshop facilitation	Aligning governance, security, data and delivery teams
Solution validation and testing support	Functional spec reviews and test traceability

2. HMRC — DWIT data migration and HIP integration transformation

Programme: Data Warehouse and Integration Transformation (DWIT) · **Role:** Senior Business Analyst (contract) · **Period:** Jul 2022 – present · **Sector:** UK central government

Challenge. HMRC ran multiple legacy data warehouses and around 2,000 point-to-point integrations. This meant duplicated data, high support costs, inconsistent data quality, limited scalability and security exposure. DWIT was set up as a strategic programme to move warehouse data to a cloud-native lakehouse (with Denodo virtualisation) and move legacy integrations onto the strategic Hybrid Integration Platform (HIP), supporting future fiscal events and ministerial commitments.

What I did

- Facilitated discovery and architecture workshops with data, security, platform and integration architects, engineers, product owners and operational users.
- Built a migration requirements catalogue covering source datasets, owners, history, frequency, volumes, retention, transformation rules and downstream consumers.
- Produced source-to-target mappings, data dictionaries, lineage views and reconciliation rules with data architects and engineers.
- Analysed legacy interfaces for HIP onboarding (protocol, volumes, error handling, security, dependencies, data ownership) and defined API requirements, interface catalogue entries and service contracts.
- Agreed per migration wave: data in and out of scope, historical period, cleansing rules, critical reports, reconciliation tolerances, rollback and sign-off owners.
- Resolved a scope conflict between business and technical teams through options analysis, agreeing a phased scope with entry criteria for later waves.
- Triaged late reconciliation variances into defects, approved transformations, source issues and tolerances, with data owners approving tolerances.
- Strengthened a high-value supplier statement of work with measurable outcomes, acceptance owners, evidence-linked milestones and RAID ownership.
- Managed RAID and traceability across DPS PODs: DAPM, Platform, ReDA, AA&C and Security.
- Defined test conditions and supported SIT, data migration testing, UAT, cutover and go-live readiness.

Result. Delivery teams gained a clear, auditable baseline for build and testing, linking every business need to migration evidence. Phased scope, owned assumptions and evidence-based readiness decisions reduced the risk of late surprises in data history or downstream dependencies.

Key artefacts: requirements catalogue, traceability matrix, source-to-target mapping, business rules catalogue, interface catalogue, user stories with acceptance criteria, decision log, RAID log, UAT scripts, cutover checklist.

Top skills required

Skill	How it was used
Data migration analysis and reconciliation	Migration scope, history, reconciliation rules and tolerances per wave
Source-to-target mapping and data modelling	Mappings, data dictionaries and lineage for lakehouse targets
API and integration analysis	Legacy interfaces assessed and specified for HIP onboarding
Requirements engineering and traceability	Functional, non-functional, security and migration requirements linked to tests
Stakeholder management and options analysis	Scope and architecture-versus-delivery conflicts resolved with evidence
Data governance and security requirements	Ownership, lineage, data quality controls and security assessments
Supplier and commercial management	Statement of work tightened for acceptance and payment
Testing, cutover and readiness	SIT, migration testing, UAT and go-live sign-off support

3. Accenture — Improving the DPS impacting process

Role: Business Process Analyst (contract) · **Period:** Jan 2021 – Jul 2022 · **Sector:** Consultancy, Data Platform Services (DPS)

Challenge. DPS manages the organisation's largest data estate through suppliers and in-house teams. Project teams raise data change requests via Clarity, and DPS returns an impact assessment from suppliers across PODs (DAPM, Platforms, Risking and Search, Advanced Analytics, Reporting and Dashboarding). Impacting averaged 50 days, delaying projects, with poor-quality supplier responses and frequent cost-query escalations. The goal was 27 days, better impact quality and fewer cost queries.

What I did

- Mapped the as-is impacting process end to end, from Clarity request and Jira tracking through architect review, D&R document, walkthrough, supplier impacting and consolidated response.
- Identified bottlenecks at each step with DPS technical BAs, architects, the engagement team, suppliers and project teams.
- Co-designed and embedded the to-be process, including the controls in the table below.
- Trained DPS colleagues to QA incoming requests for clarity, completeness and technical readiness.
- Facilitated D&R walkthroughs and dependency and scheduling meetings so impactors, risks, assumptions and constraints were surfaced and owned early.
- Trained technical BAs to consolidate multiple supplier responses into a single, coherent impact assessment.

Bottleneck (as-is)	Fix introduced (to-be)
Unclear or incomplete requests on Clarity	Projects provide clear, adequate information; DPS rejects unclear requests or those outside the DPS data estate
DPS staff unsure how to QA requests	Training on request QA and required information
D&R template not standardised; impactors missed	Standard D&R template; only baselined D&Rs issued; impactors identified up front
Walkthroughs missed or repeated	Walkthrough within 3 days of D&R; all parties agree deliverables before impacting starts
Dependencies and constraints raised late	Dependency and scheduling meeting within 5–10 working days of issue; issues logged with owners
15-day supplier SLA often missed and not monitored	Standardised supplier impact (SOW) format; SLA compliance enforced
SOWs with high cost, missing RAIDs, inconsistent format	Technical BA and POD lead review SOW against D&R scope, assign RAID owners, query cost early

Result. Average impacting time fell from 50 to 27 days within six months. Impact quality improved, customer cost queries reduced and project delivery improved by 25%.

Top skills required

Skill	How it was used
As-is / to-be process mapping and bottleneck analysis	End-to-end impacting process redesigned
Process improvement and governance design	Standard templates, QA gates and timed walkthrough and dependency meetings
Technical requirements translation	Change requests split into POD-aligned requirements in the D&R
Supplier and SLA management	Standard SOW format and SLA compliance
Impact assessment and cost review	SOW scope, RAID and cost checks before return to customer
Facilitation and cross-team coordination	Walkthroughs and dependency sessions across PODs and suppliers
Coaching and knowledge transfer	Training on request QA and impact consolidation

4. Barclays — Automated credit-limit decision workflow

Role: Business Analyst (contract) · **Period:** Aug 2019 – Dec 2020 · **Sector:** Retail banking, credit risk

Challenge. Credit-limit decisions relied on heavy manual review, taking days to approve. This slowed customers down, added operational cost and made risk control harder to apply consistently.

What I did

- Worked with credit risk, compliance and underwriting teams to understand current decision workflows and find bottlenecks.
- Mapped detailed as-is and to-be credit workflows, clarifying decision points, data dependencies and automation opportunities.
- Analysed historical credit-limit data, approval patterns and default trends to inform new scoring rules and risk thresholds.
- Translated risk policies into BRDs, FSDs and Agile user stories with unambiguous decision logic.
- Designed and ran UAT scenarios with business users to confirm automated decisions matched regulatory requirements and risk appetite.
- Refined the backlog with product owners, engineers and QA, keeping every business rule traceable end to end.

Result. Manual reviews fell by 40% and approval time dropped from days to minutes, improving customer experience, strengthening risk control and lowering cost.

Top skills required

Skill	How it was used
Business rules and decision logic analysis	Risk policy turned into automated decision rules
Data analysis	Approval patterns and default trends informed scoring thresholds
Process mapping and automation analysis	As-is / to-be credit workflows and automation points
Requirements documentation (BRD, FSD, user stories)	Unambiguous specs for developers
UAT design and execution	Scenarios validating decisions against risk appetite
Risk and compliance domain knowledge	Alignment with credit risk policy and regulation

5. Octopus Energy — Smart meter installation journey

Role: Digital Business Analyst, Agile product delivery (contract) · **Period:** Sep 2018 – Jul 2019 · **Sector:** Energy retail

Challenge. Too many smart meter installations failed first time, through delays, failed installs and missed appointments. This hurt customer experience and wasted field engineer capacity.

What I did

- Partnered with operations, product and field teams to refine the end-to-end installation journey and remove friction points.
- Analysed installation performance, customer feedback and engineer data to find root causes of failures and missed appointments.
- Translated findings into user stories and process improvements for booking flows and customer communications.
- Supported delivery teams with dashboards, insights and change-ready processes.

Result. First-time smart meter installation success rose by 25% within six months, improving operational efficiency and customer satisfaction.

Top skills required

Skill	How it was used
Customer journey analysis	End-to-end installation journey redesigned
Root cause and data analysis	Performance, feedback and engineer data analysed
Agile product delivery and user stories	Booking-flow improvements delivered through the backlog
Dashboards and reporting	Insights for delivery and operations teams
Cross-functional collaboration	Operations, product and field teams aligned
Process improvement	Targeted fixes to booking and communications

6. Black Country Healthcare NHS FT — EPR requirements and procurement

Role: Business Analyst (contract) · **Period:** Jun 2017 – Aug 2018 · **Sector:** NHS healthcare

Challenge. The Trust was moving from paper-based pathways to a new Electronic Patient Record (EPR) system. It needed validated requirements and processes clinicians trusted, to make a confident procurement decision.

What I did

- Captured clear, actionable EPR requirements with clinical, operational and digital teams.
- Facilitated workshops across clinical, operational and corporate services to baseline current processes and co-design future digital workflows.
- Produced end-to-end process maps, gap analyses, requirements documents and procurement-ready specifications.
- Supported procurement by developing evaluation criteria and making sure documents met NHS governance standards.
- Worked with configuration specialists so the EPR design reflected real clinical needs.
- Identified policy, process and workflow changes needed for the move from paper to digital.

Result. A fully validated requirements and process-mapping pack accelerated the EPR procurement decision by 30% and strengthened clinical confidence in the solution.

Top skills required

Skill	How it was used
Requirements elicitation with clinical users	Actionable EPR requirements from frontline staff
Workshop facilitation and co-design	Current processes baselined, future workflows co-designed
Process mapping and gap analysis	End-to-end clinical and operational process maps
Procurement support and evaluation criteria	Procurement-ready specs and scoring criteria
Business change management	Policy and workflow changes for paper-to-digital transition
NHS governance and compliance	Documentation meeting NHS standards

Skills across the portfolio

Stakeholder engagement, process mapping and requirements engineering appear in every project; these are the core of the portfolio. Data analysis and regulated-environment experience run through five of the six.

Skill	1 HMRC GDPR	2 HMRC DWIT	3 Accenture	4 Barclays	5 Octopus	6 NHS EPR	Count
Stakeholder engagement and facilitation	✓	✓	✓	✓	✓	✓	6
